# FPGA badge hack: Linux on RISC-V... using Python!

*Python User Group Meeting (2020-02-13)*

**Drew Fustini**  
[drew@oshpark.com](mailto:drew@oshpark.com)  
Twitter: [@pdp7](https://twitter.com/pdp7)

- When you write a program in the Arduino IDE, it is compiled into instructions for the microcontroller to execute.
- How does the compiler know what instructions the chip understands?
  - defined by the **Instruction Set Architecture**
  - The **ISA** is a standard, a set of rules that define the tasks the processor can perform.
  - Examples: x86 (Intel/AMD) and ARM
    - Both are proprietary and need commercial licensing

- **RISC-V: Free and Open RISC Instruction Set Arch**
  - “new instruction set architecture (ISA) that was originally designed to support computer architecture research and education and is now set to become a standard open architecture for industry”

- Keynote at Hackday Supercon 2019 by Dr. Megan Wachs of SiFive

  - [https://www.youtube.com/watch?v=vCG5\\_nxm2G4](https://www.youtube.com/watch?v=vCG5_nxm2G4)

- My column in the latest Hackspace Magazine is an introduction to RISC-V and how it is enabling open source chip design:
  - [hackspace.raspberrypi.org/issues/27/](https://hackspace.raspberrypi.org/issues/27/)

Drew Fustini

COLUMN

## Open-source chips

Breaking free of chip design monopolies with RISC-V

Drew Fustini

**W**hen we think about what open-source hardware means, we usually think about the board design being freely available. But what about the processor? Is there a way to make hardware that is truly open source? This month's column is dedicated to an existing – and surprisingly political – development in chip design.

When you write a program in the Arduino IDE, it is compiled into instructions for the microcontroller to execute. How does the compiler know what instructions the chip understands? This is defined by the Instruction Set Architecture. The ISA is a standard, a set of rules that define the tasks the processor can perform.

Chances are that both your laptop and the data centre streaming your favourite movie are using an ISA owned by Intel or AMD. The processor in your smartphone is almost certainly using a proprietary ISA licensed from ARM. Proprietary standards can be overpriced, prevent innovation, or even disappear altogether when companies change strategy.

Enter RISC-V, a free and open ISA created by researchers at UC Berkeley, led by Krste Asanović and David Patterson. "We were always jealous that you could get industrial-strength software that was

open," Patterson explained to VentureBeat at the RISC-V Summit back in December. "But when it came to hardware, it was proprietary. Now, with RISC-V, we get the same kind of benefit. It helps education, and it helps competition."

This open standard proved to be useful outside of academia. Nvidia and Western Digital are now shipping millions of devices with RISC-V processors. These companies have the freedom to leverage open-source implementations while avoiding ARM licensing fees – which can really add up when shipping large volumes.

The ISA is a standard, a set of rules that define the tasks the processor can perform

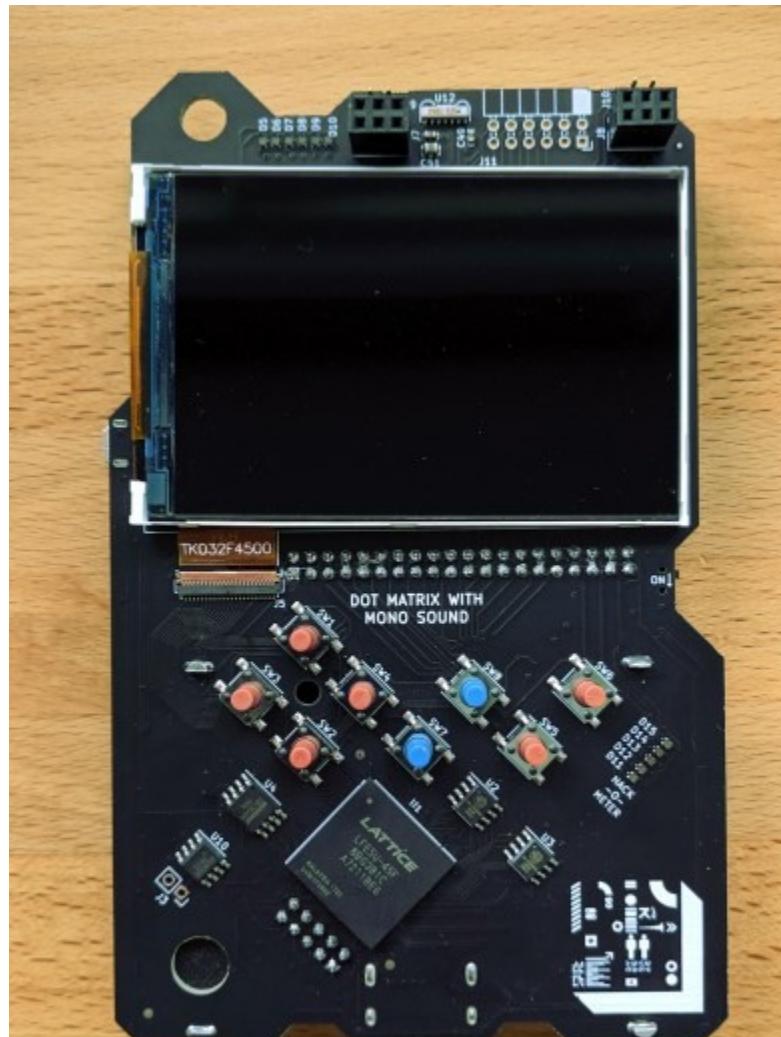

Nations such as India see the importance of being able to create processors that are not under the control of a foreign corporation, who may be forced to build in backdoors for their own government. There is also strong interest from chipmakers in China, especially now that US companies have been banned from doing business with Huawei.

With these financial and political motivations, plus an increasingly mature software ecosystem, including Linux support, it won't be long before you have a device with a RISC-V processor in your home or pocket.

You can learn more about the exciting possibilities that RISC-V unleashes from Dr. Megan Wachs by pointing your web browser to [hsmag.cc/qw-led](https://hsmag.cc/qw-led).

@pdpf

Drew Fustini is a hardware designer and embedded Linux developer. He is the Vice President of the Open Source Hardware Association, and a board member of the BeagleBoard Foundation. Drew designs circuit boards for OSH Park, a PCB manufacturing service, and maintains the Adafruit BeagleBone Python library.

FPGA

FPGAs have been the talk of the town at many of this year's hacker conferences. But what exactly is an FPGA, and why are they so hot right now?

FPGA stands for Field Programmable Gate Array, a digital logic chip that can be programmed to reconfigure the internal hardware. An FPGA does not run software – it physically changes the configuration of its gate arrays to adapt to the task at hand. Is an FPGA an incredibly versatile tool? Need 25 PWM pins for a project? No problem. Want to replicate the functionality of a vintage CPU? Your FPGA has you covered. Not only is an FPGA versatile, but it is also better at handling timing-critical tasks than a microcontroller. You can filter high-speed sensor data before it's read by your processor, or offload repetitive tasks like debouncing buttons from the burden on your microcontroller.

FPGAs are hot right now but they're not a new technology – they've been used in industry for decades

The Lattice ECP5 FPGA is capable of more advanced features than the iCE40, and it's easier to get started with too, thanks to Project Trellis led by David Shah. This enabled the ECP5-powered Supercon badge to have cool features like HDMI video, while still being open for anyone to hack on without requiring proprietary tools.

FPGAs are a fascinating technology with lots of awesome applications. If you want to find out more, start off by reading Luke Valenty's *The Hobbyists Guide to FPGAs on Hackaday.io*. ([hsmag.cc/GOAQnR](https://hsmag.cc/GOAQnR)), and watch Tim Ansell's Supercon talk to learn about the exciting future of open-source FPGA tools ([hsmag.cc/kY5IPD](https://hsmag.cc/kY5IPD)). □

The rise of the FPGA

Reconfigure your chips to suit your project

This opened the door for low-cost, open hardware boards such as mystorm Blackice, TinyFPGA, iCEBreaker, and Fomu, which are great tools for teaching workshops and building projects.

Add the [Hackaday Supercon 2019 badge](#) which has an ECP5 FPGA.

These changes are from a [fork](#) by Michael Welling (@mwelling)

During Supercon, we tried two approaches:

- use the built-in 16MB QSPI SRAM
- use add-on cartridge with 32MB SDRAM by Jacob Creedon

We were not able to get the QSPI SRAM working so I've removed those changes, and I have just added the changes that are needed to boot Linux with the 32MB SDRAM.

In addition to @mwelling, thank you to Jacob Creedon (@jcreedon), @gregdavill, Tim Ansell (@mithro), and Sean Cross (@xobs) who all helped get Linux working on this badge.

[Related to comments in PR #31 \(comment\)](#)

The performance of the ECP5 Hackaday Badge with 32MB SDRAM is "painfully" slow.

@mithro suggested there could be some issue with the configuration.

@enjoy-digital has attempted some optimizations:

[#31 \(comment\)](#)

With [enjoy-digital/litedram@ 34e6c24](#) and [enjoy-digital/litex@ fa22d6a](#) we have a ~10% boot time speedup on designs using SDRAM:

- De0Nano: 94.6.s to 84.6s
- ULX3S: 75.9s to 68.2s

On Arty with DDR3 the gain is effect more limited: 8.7s to 8.4s. That would be interesting to test this on the badge.

I will measure if the boot time improve

Open
