## Statement of Principles:

Hardware whose **design** is made **publicly available** so that anyone can **study**, **modify**, **distribute**, **make**, and **sell** the design or hardware based on that design

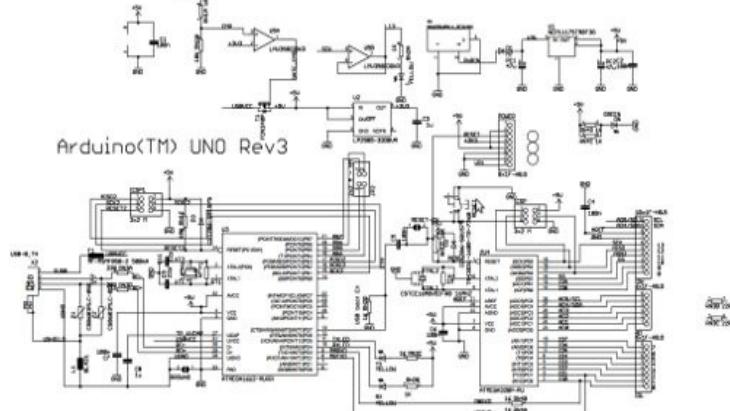

# Open Source Hardware

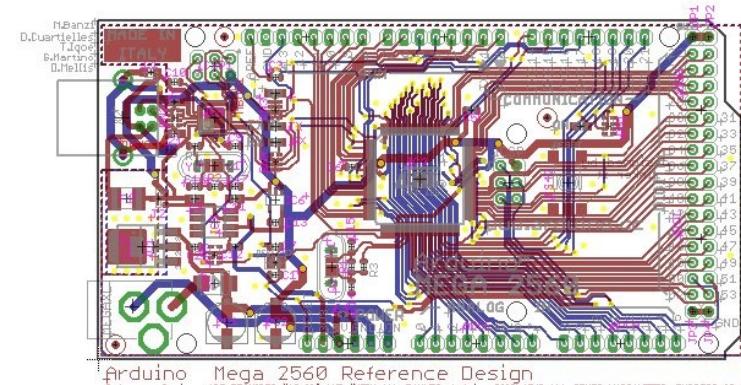

Documentation required for electronics:

## Schematics

## Board Layout

**Editable** source files for CAD software such as KiCad or EAGLE

## Bill of Materials (BoM)

Not strict requirement, but best practice is for all components available from distributors in **low quantity**

# 36c3 talk: Linux on Open Source Hardware with Open Source chip design

## CERN Open Hardware Licence

- Originally written for **CERN** designs hosted in the **Open Hardware Repository**
- Can be used by **any designer** wishing to **share design** information using a **license compliant** with the **OSHW definition criteria**.
- [\*\*CERN OHL version 1.2\*\*](#)  
Contains the license itself and a guide to its usage

Slides: <https://github.com/pdp7/talks/blob/master/rv-elc.pdf>

*Section:*  
RISC-V

the instruction set for everything?

- When you write a C or C++ program, it is compiled into instructions for the microprocessor (CPU) to execute.
- How does the compiler know what instructions the CPU understands?
  - defined by the **Instruction Set Architecture**
  - The **ISA** is a standard, a set of rules that define the tasks the processor can perform.
  - Examples: x86 (Intel/AMD) and ARM
    - Both are proprietary and need commercial licensing

- **RISC-V: Free & Open RISC Instruction Set Arch**
  - “new instruction set architecture (ISA) that was originally designed to support computer architecture research and education and is now set to become a standard open architecture for industry”
  - The **5th** RISC instruction to come out out UC Berkeley
  - RISC = Reduced Instruction Set Computer

- **RISC-V: Free & Open RISC Instruction Set Arch**

- Instruction Sets Want To Be Free: A Case for RISC-V
  - David Patterson, UC Berkeley – *co-creator of the original RISC!*
  - <https://www.youtube.com/watch?v=mD-njD2QKN0>
- **RISC-V Summit 2019: State of the Union**
  - Krste Asanovic, UC Berkeley
  - [https://www.youtube.com/watch?v=jdkFi9\\_Hw-c](https://www.youtube.com/watch?v=jdkFi9_Hw-c)
- **Watch the Krste's KEYNOTE tomorrow!**
  - “RISC-V: Instruction Sets Want to be Free”
  - **Wednesday, July 1 • 10:35am – 10:55am**
  - <https://sched.co/c4PV>

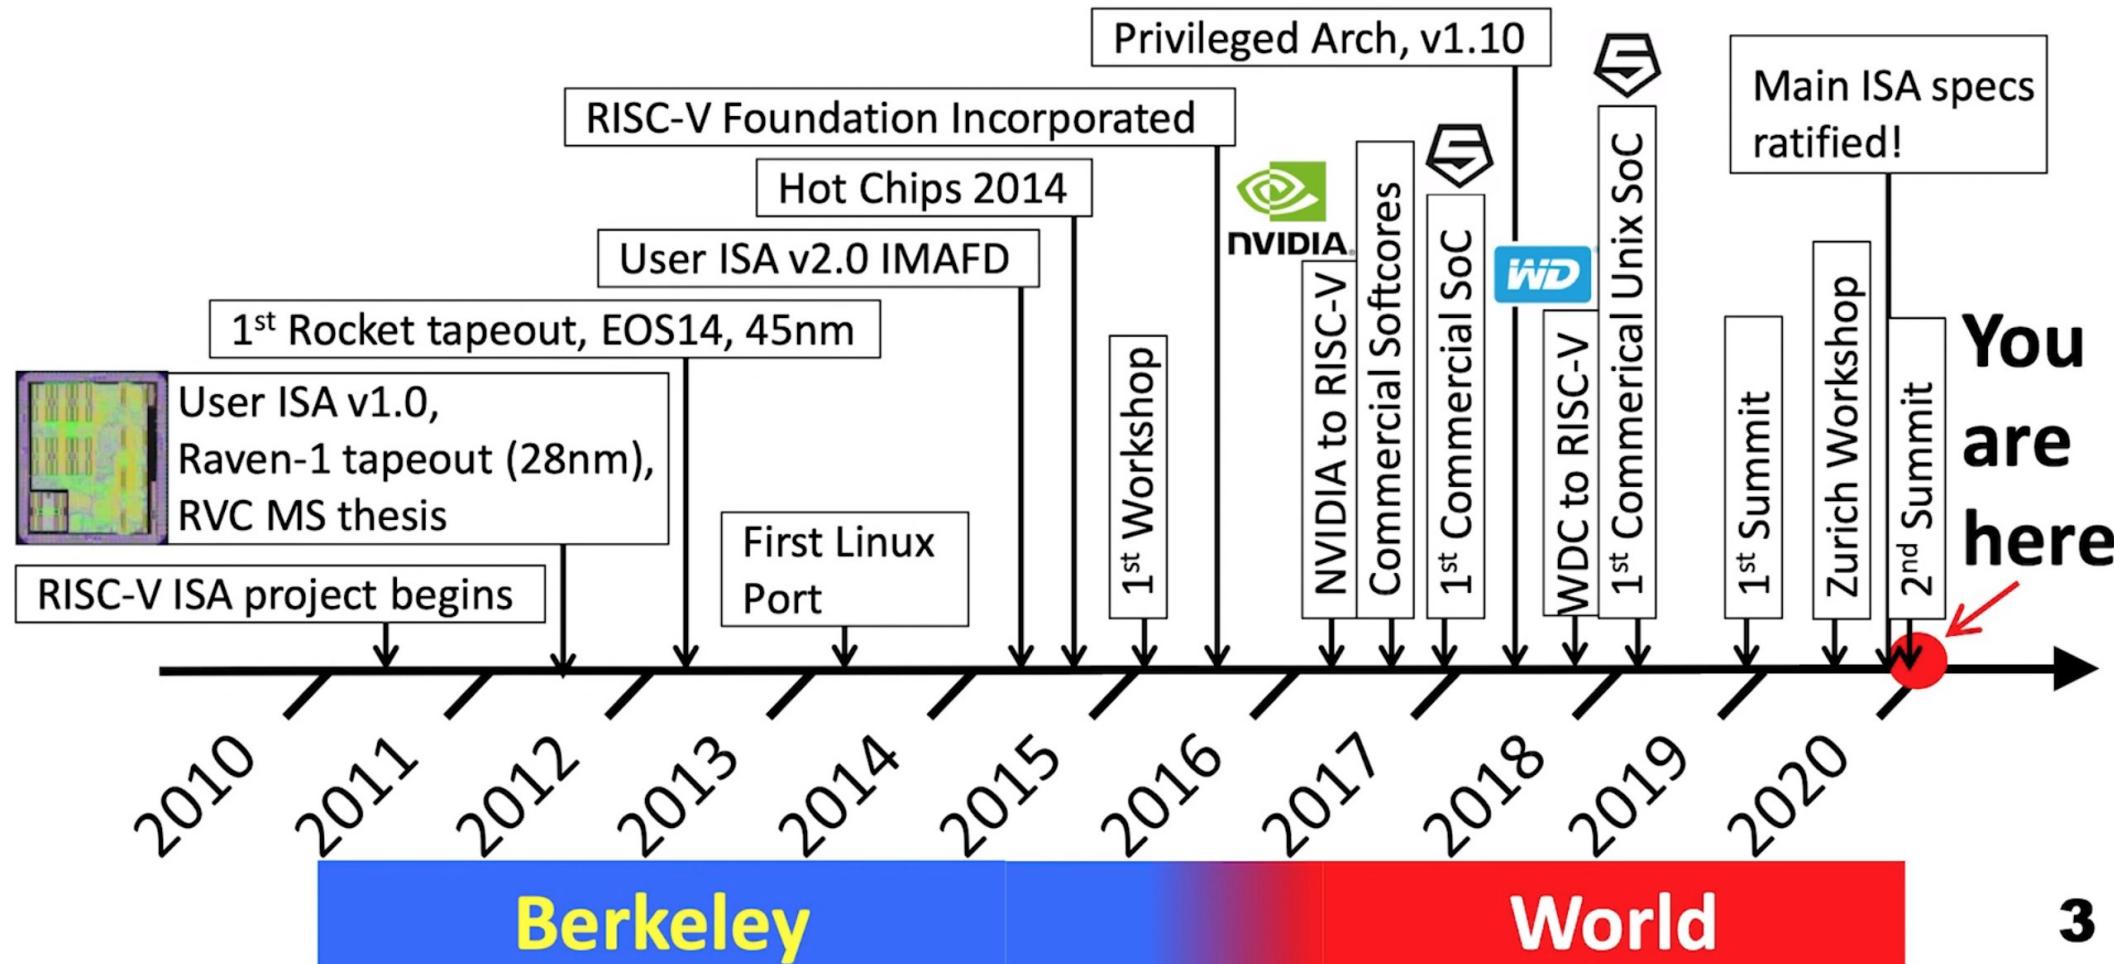

# What's Different about RISC-V?

- ***Simple***
  - Far smaller than other commercial ISAs
- ***Clean-slate design***
  - Clear separation between user and privileged ISA
  - Avoids μarchitecture or technology-dependent features
- A ***modular*** ISA designed for ***extensibility/specialization***
  - Small standard base ISA, with multiple standard extensions
  - Sparse and variable-length instruction encoding for vast opcode space
- ***Stable***
  - Base and standard extensions are frozen
  - Additions via optional extensions, not new versions
- ***Community designed***
  - With leading industry/academic experts and software developers

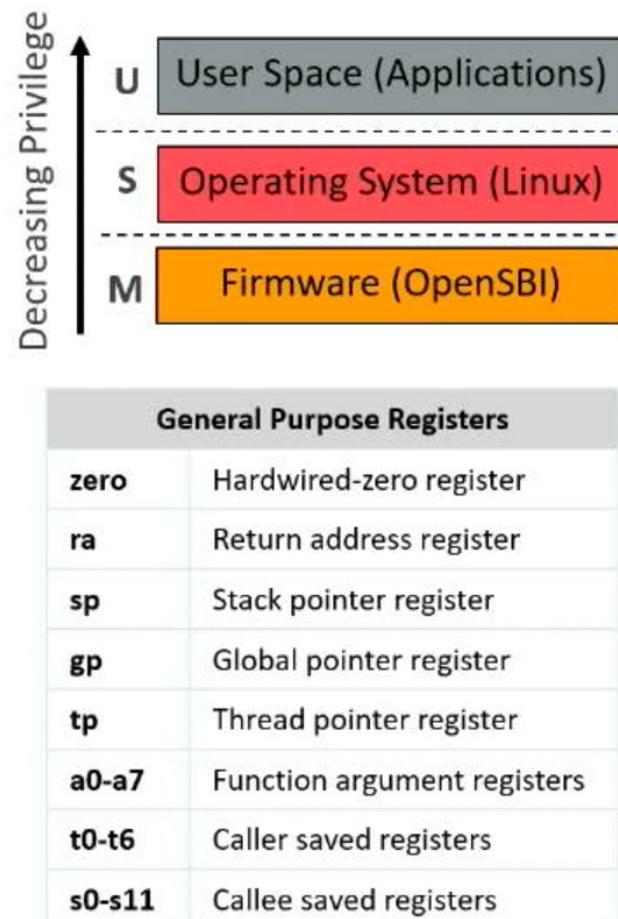

# RISC-V Timeline

## What is RISC-V ?

### Free and Open Instruction Set Architecture (ISA)

- Clean-slate and Extensible ISA
- **XLEN (machine word length)** can be 32 (RV32), 64 (RV64), and 128 (RV128)
- **32 general purpose registers**
- **Variable instruction length** (instruction compression)
- **Three privilege modes:** Machine (M-mode), Supervisor (S-mode), and User (U-mode)
- **Control and Status Registers (CSR)** for each privilege mode

S-mode CSRs (Used By Linux)	
sstatus	Status
sie	Interrupt Enable
sip	Interrupt Pending
stvec	Trap Handler Base
sepc	Trap Program Counter
scause	Trap Cause
stval	Trap Value
satp	Address Translation
sscratch	Scratch

NOTE: **sdeleg**, **sideleg**, and **scounteren** not used currently

## RISC-V Extension

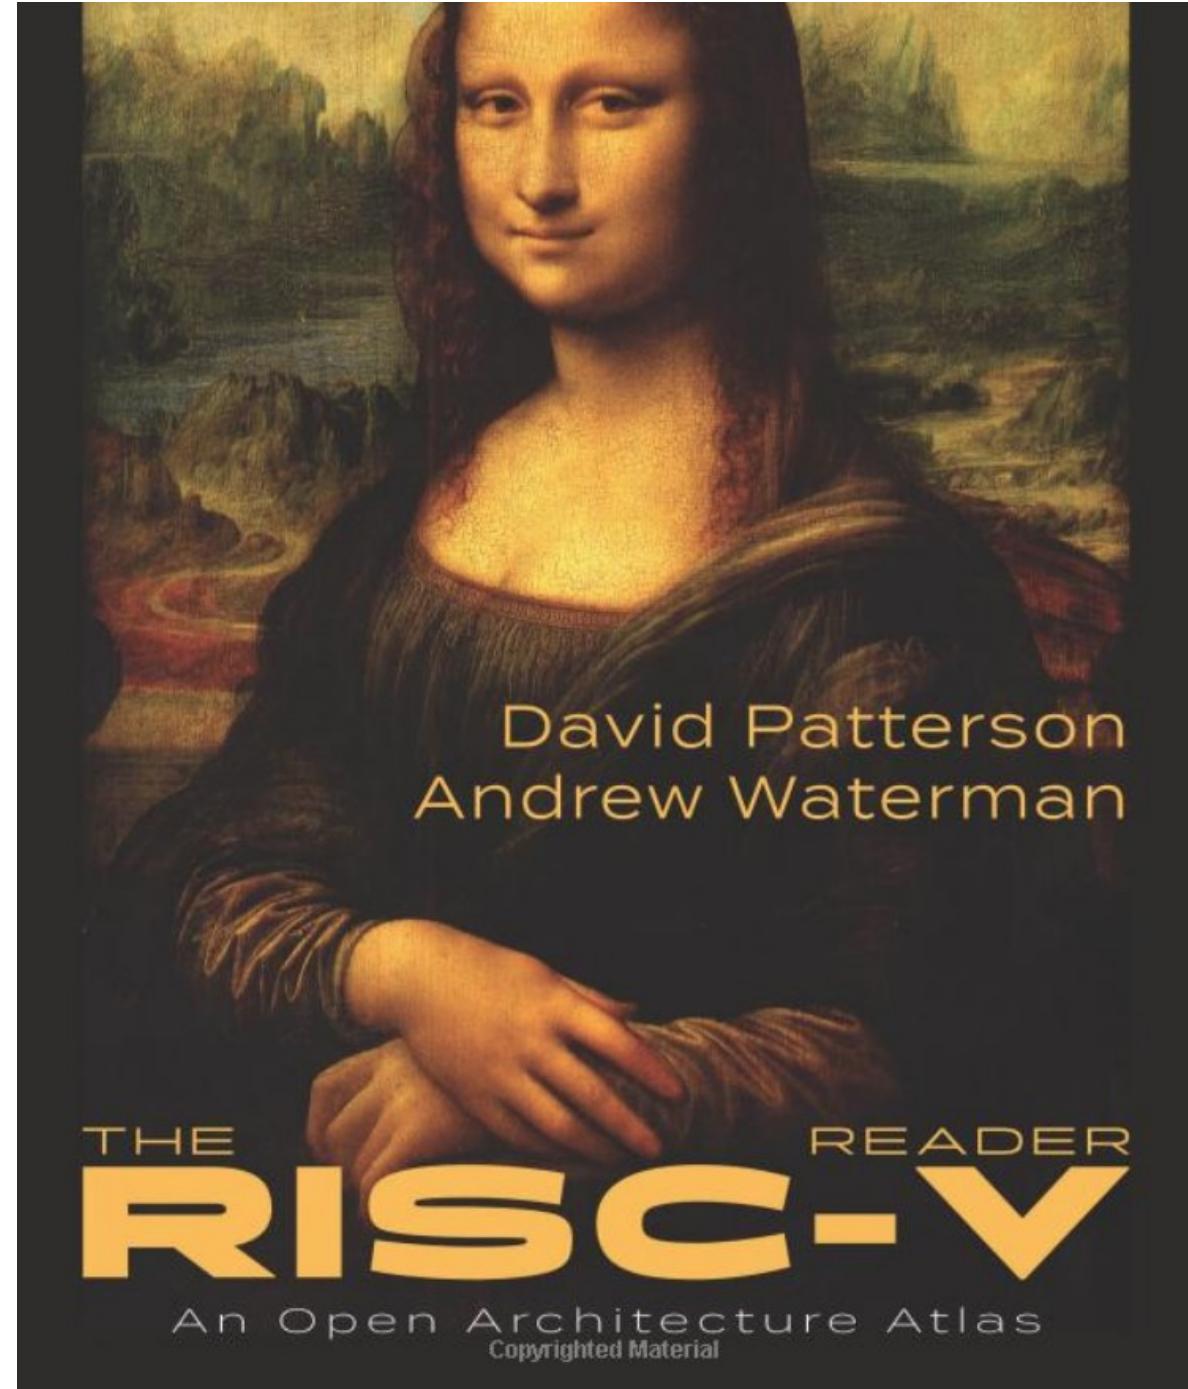

**It is a set of ISAs and not one ISA**

- RISC-V is a set of ISAs where each ISA is called an **RISC-V extension**
- **Standard naming notation** for ISAs supported by RISC-V implementation:
  - RV – Indicates RISC-V architecture
  - [###] – {32, 64, 128} Indicates register length
  - [abc..xyz] – Indicates set of extensions
- **Examples:** RV64IMA, RV64GC, RV32I, RV32IM
- **Linux needs:**
  - RV64IMAC
  - RV64IMAFDC (aka RV64GC)
  - RV32IMAC
  - RV32IMAFDC (aka RV32GC)

Extension	Description
I	Integer
M	Integer multiplication and division
A	Atomics
F	Single-precision floating point
D	Double-precision floating point
G	General purpose = IMAFD
C	16bit compressed instructions
H	Hypervisor
V	Vector
... And More ...

# RISC-V Ecosystem

## Open-source software:

Gcc, binutils, glibc, Linux, BSD,  
LLVM, QEMU, FreeRTOS,  
ZephyrOS, LiteOS, SylixOS, ...

## Commercial software:

Lauterbach, Segger, IAR,  
Micrium, ExpressLogic, Ashling,  
AntMicro, Imperas, UltraSoC ...

## Software

ISA specification

Golden Model

Compliance

## Hardware

### Open-source cores:

Rocket, BOOM, RI5CY,  
Ariane, PicoRV32, Piccolo,  
SCR1, Shakti, Serv, Swerv,  
Hummingbird, ...

### Commercial core providers:

Alibaba, Andes, Bluespec,  
Cloudbear, Codasip, Cortus,  
InCore, Nuclei, SiFive,  
Syntacore, ...

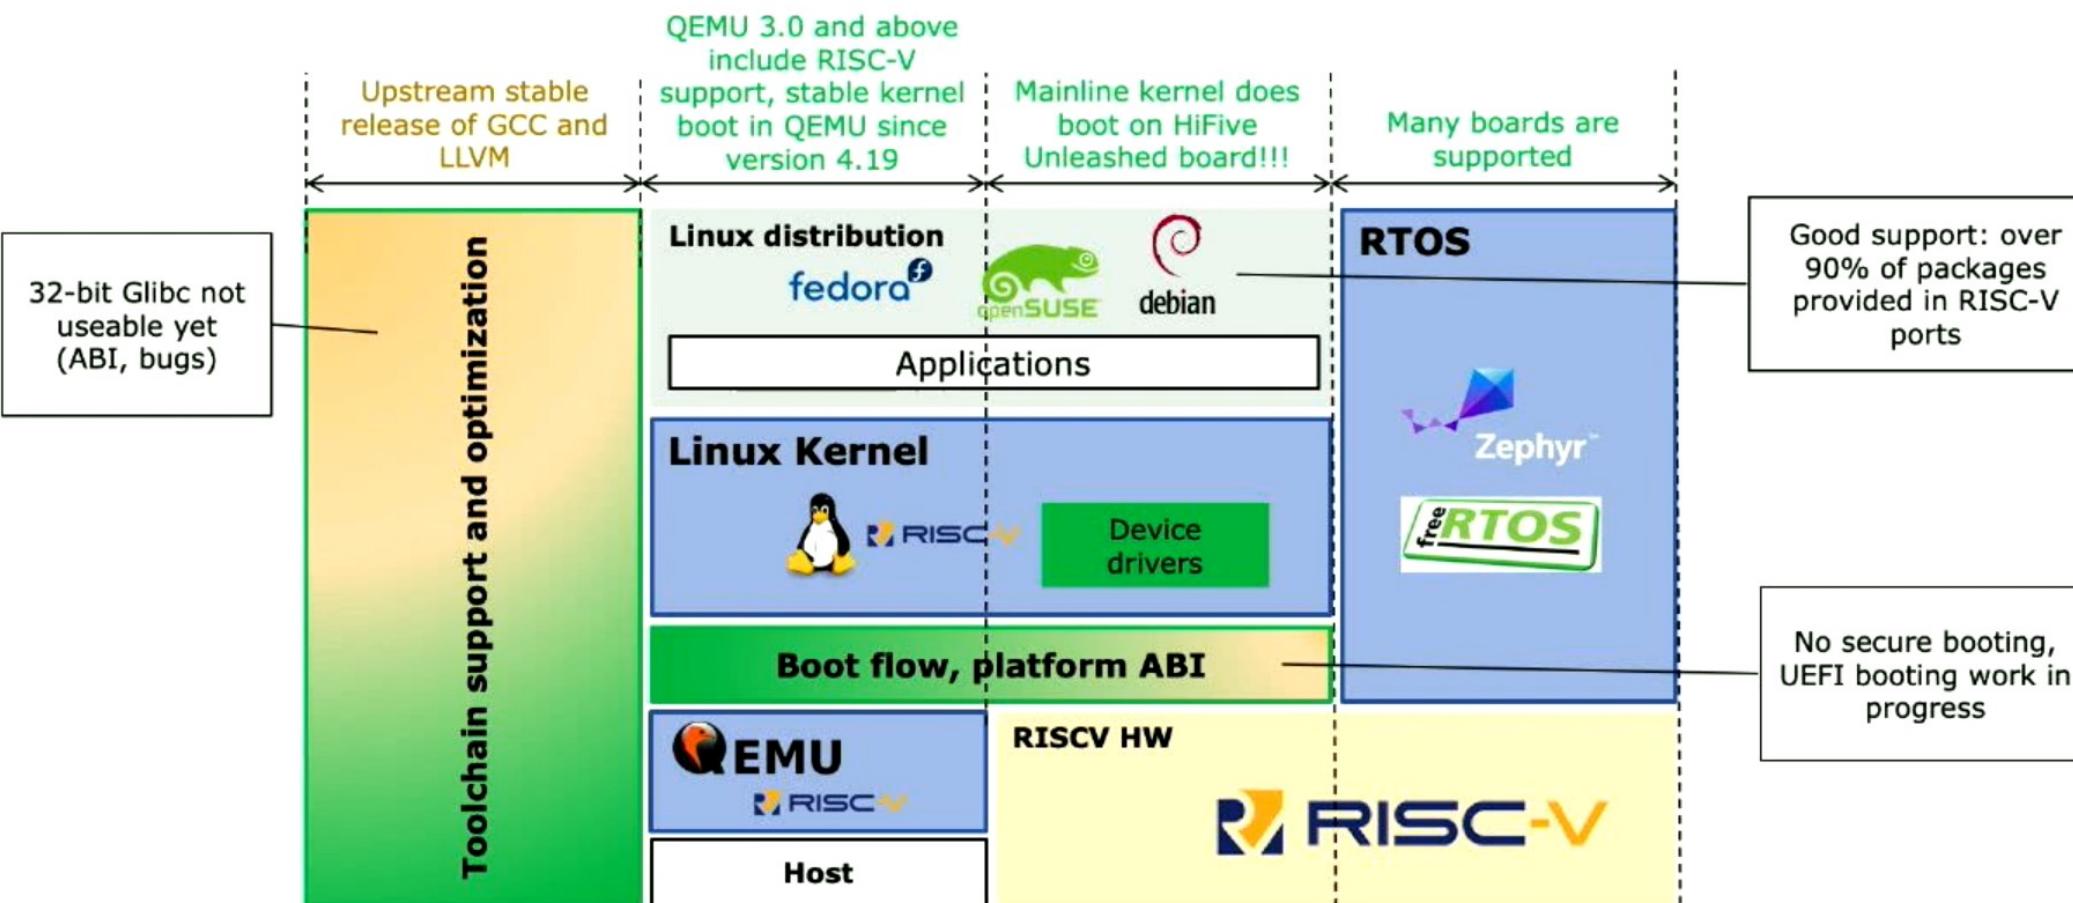

### Inhouse cores:

Nvidia, WD, +others

"RISC-V software ecosystem in 2020" - Atish Patra (LCA 2020)  
<https://youtu.be/qwkab2Z44pk>

# Linux Ecosystem: Status At-a-glance

Fast progress but more work needed

# RISC-V at ELC

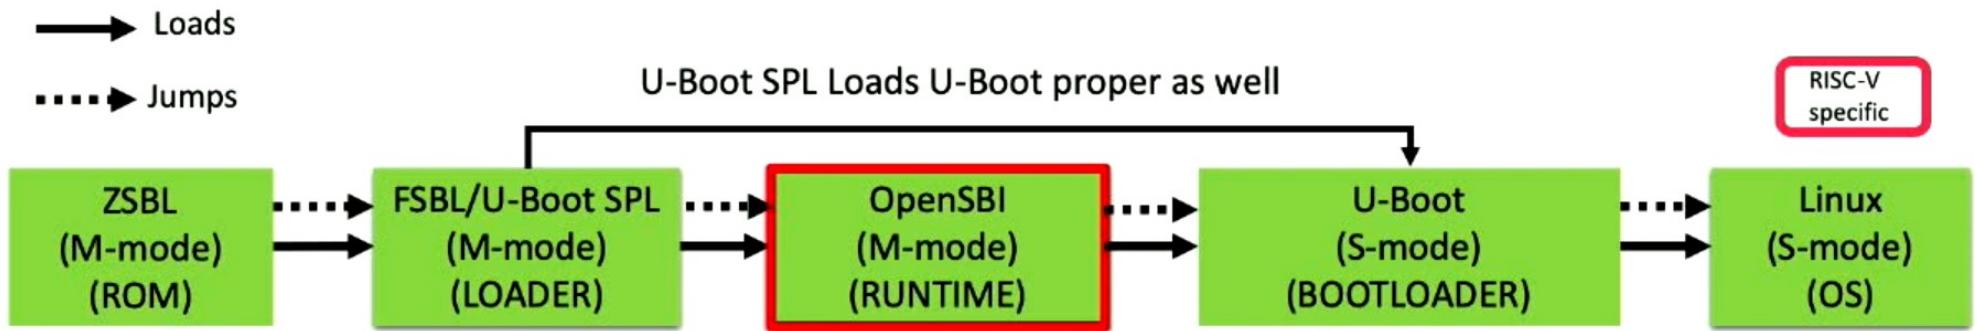

- Go RISC-V Go:  
State of Software Development Tools for RISC-V
  - Khem Raj (Comcast)
  - TOMORROW Wednesday 12:15pm
  - <https://sched.co/c3Yn>

“Clang/LLVM has newly added backends for RISC-V. In addition, there is now a golang port, which is still out of tree but headed towards upstream acceptance. Additionally, GCC is working towards the GCC-10 release, with several new enhancements to its RISC-V backend. The LLVM backend also means Rust can now cross-compile to the RISC-V architecture. The MUSL C library also has a new RISCV 64-bit port. Additionally, we will discuss the state of tools on the RV32 ecosystem, progress on the glibc port for RV32, and Yocto Project support for RV32 in its core, where QEMU RV32 port is usable for doing application port.”

"RISC-V software ecosystem in 2020" - Atish Patra (*LCA 2020*)  
– <https://youtu.be/qwkab2Z44pk>

## RISC-V Boot Flow

Follows commonly used multiple boot stages model

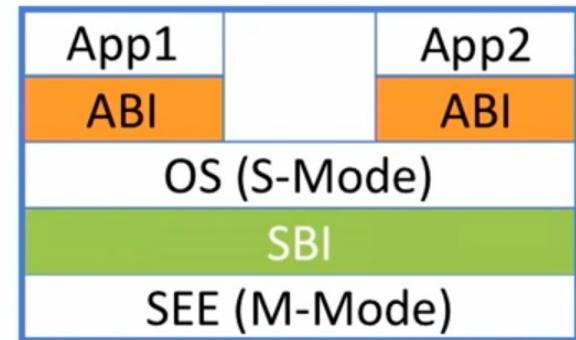

- Follows a standard boot flow
- Uses U-Boot proper as the last stage boot loader
- FSBL is SiFive specific and will be replaced by Coreboot/U-Boot SPL
- OpenSBI is a RISC-V specific runtime service provider
- All harts jump to Linux at the same time and a lottery-based approach chooses the booting hart

# "OpenSBI Deep Dive" - Anup Patel (*RV Workshop 2019*)

- <https://youtu.be/jstwB-o9II0>

## What is SBI ?

- SBI stands for RISC-V Supervisor Binary Interface
  - System call style calling convention between Supervisor (S-mode OS) and Supervisor Execution Environment (SEE)
- SEE can be:
  - A M-mode RUNTIME firmware for OS/Hypervisor running in HS-mode
  - A HS-mode Hypervisor for Guest OS running in VS-mode
- SBI calls help:
  - Reduce duplicate platform code across OSes (Linux, FreeBSD, etc)
  - Provide common drivers for an OS which can be shared by multiple platforms
  - Provide an interface for direct access to hardware resources (M-mode only resources)
- Specifications being drafted by the Unix Platform Specification Working group
  - Maintain and evolve the SBI specifications
  - Currently, SBI v0.1 in-use and SBI v0.2 in draft stage

"OpenSBI Deep Dive" - Anup Patel (*RV Workshop 2019*)  
– <https://youtu.be/jstwB-o9II0>

## What is OpenSBI ?

- OpenSBI is an open-source implementation of the RISC-V Supervisor Binary Interface (SBI) specifications
  - Licensed under the terms of the BSD-2 clause license
  - Helps to avoid SBI implementation fragmentation
- Aimed at providing RUNTIME services in M-mode
  - Typically used in boot stage following ROM/LOADER
- Provides support for reference platforms
  - Generic simple drivers included for M-mode to operate
    - PLIC, CLINT, UART 8250
  - Other platforms can reuse the common code and add needed drivers

# UEFI Support

- [RFC PATCH 00/11] Add UEFI support for RISC-V
  - Atish Patra (June 25, 2019)
  - “This series adds UEFI support for RISC-V”
    - Linux kernel: 5.8-rc2
    - U-Boot: master
    - OpenSBI: master

# QEMU

## In very good shape

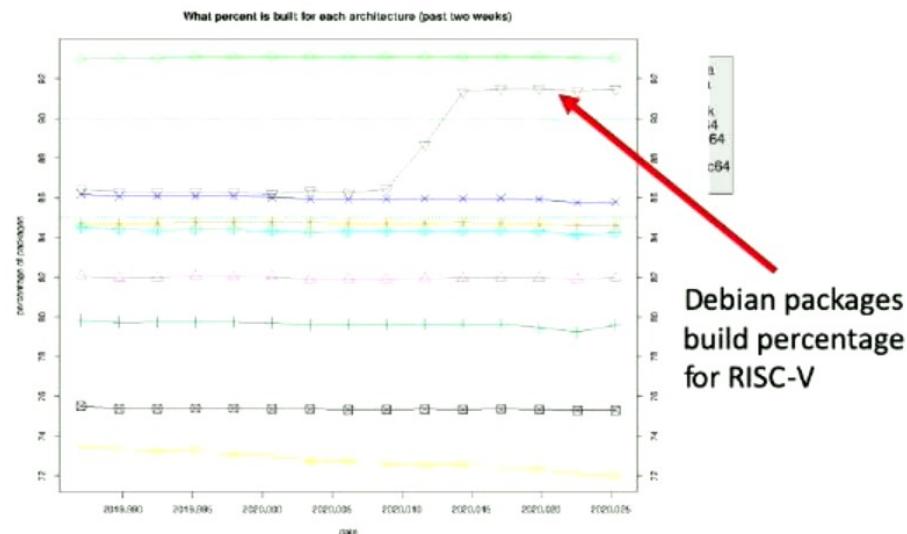

- Use mainline QEMU ! No forks !
- QEMU can boot 32-bit and 64-bit mainline Linux since kernel 4.19
- QEMU can run OpenSBI, U-Boot and Coreboot
- OpenSBI v0.5 included with QEMU
- Hypervisor extensions v0.5 supported
  - Patches waiting for review
  - Specifications not frozen yet
- Vector extensions
  - Patches are in mailing list
  - Specifications not frozen yet
- Newest QEMU 4.2 brings many improvements
  - QEMU sifive\_u machine can now boot same binaries that run on HiFive Unleashed
  - SPI flash on virt machine and HiFive Unleashed modelled. This allows FSBL (oreboot and coreboot) testing on QEMU
  - PMP access improvements
  - Support loading initrd for sifive\_u machine

## Linux Distributions

**Fedora, Debian and OpenSuse are very active**

- Fedora: stage 4 disk images released
    - <https://fedoraproject.org/wiki/Architectures/RISC-V>
    - Supports 3 boards + 142 QEMU VMs
    - Fedora 32/Rawhide including debug and source packages
  - Debian
    - <https://wiki.debian.org/RISC-V>
    - ~92% of packages built
  - OpenSuse Tumbleweed
    - <https://download.opensuse.org/ports/riscv/>
  - OpenEmbedded has RISC-V support
    - Demos of running Plasma Mobile and Mycroft are available
    - <https://github.com/riscv/meta-riscv>

## RISC-V graphical desktop on Fedora

# RISC-V and Industry

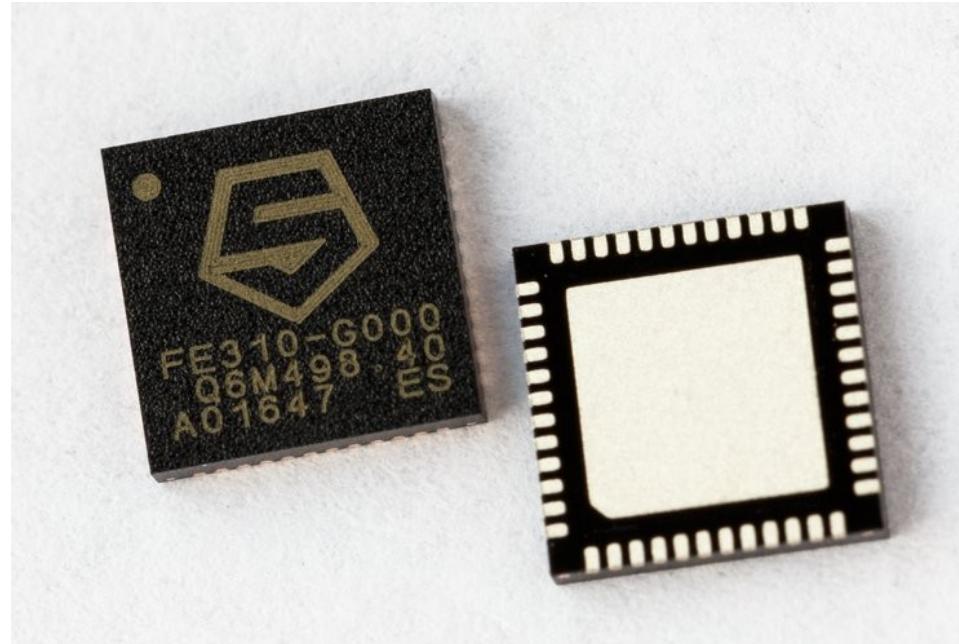

- Designed to be extensible: microcontroller to supercomputer!
- RISC-V International now controls standard: [riscv.org](http://riscv.org)
  - Over 400 members: companies, universities and more
  - Transitioning from RISC-V Foundation to Swiss-based RISC-V International
  - [YouTube channel has hundreds of talks!](#)
- Companies like Nvidia and Western Digital will ship millions of devices
- Avoid ISA licensing fees
- Freedom to choose micro-architecture implementation
  - only a few companies like Apple and Qualcomm have licenses to do with ARM
- Freedom to leverage existing open source implementations
  - Berkeley's Rocket and BOOM, ETH Zurich's PULP cores, Western Digital SweRV

- **lowRISC** is a not-for-profit organization whose goal is to produce a fully open source System-on-Chip (SoC) in volume
  - “We will produce a SoC design to populate a low-cost community development board and to act as an ideal starting point for derivative open-source and commercial designs”
- OpenTitan project with Google
  - Announcing OpenTitan, the First Transparent Silicon Root of Trust

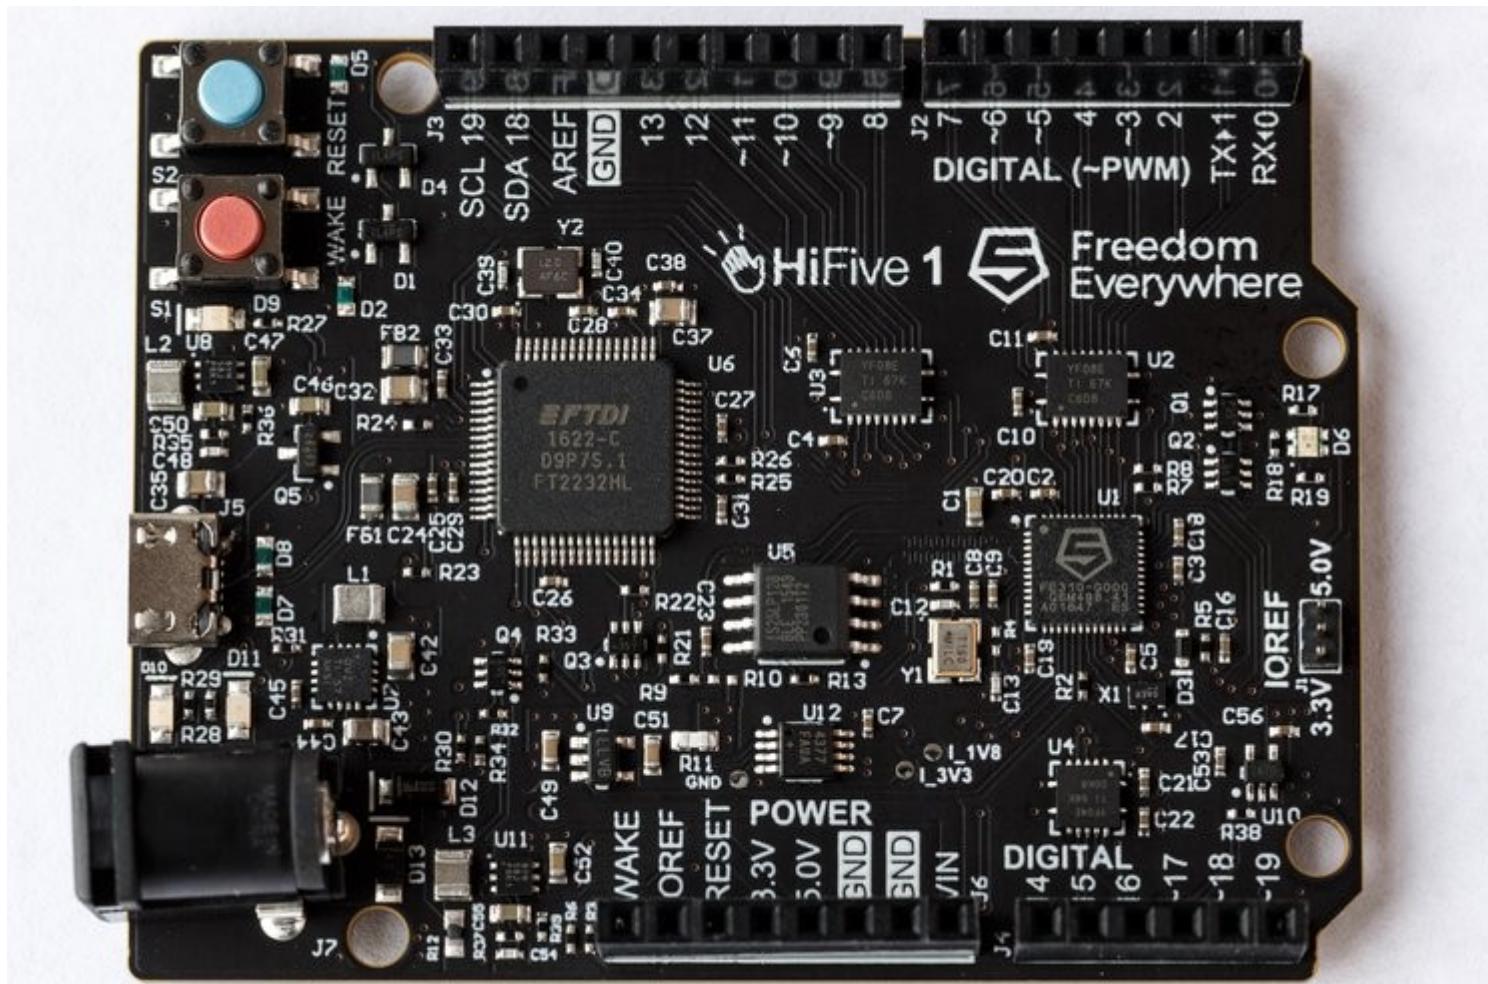

# SiFive

- “founded by the creators of the free and open RISC-V architecture as a reaction to the end of conventional transistor scaling and escalating chip design costs”

# SiFive FE310 microcontroller

- **HiFive1**: Arduino-Compatible RISC-V Dev Kit

Slides: <https://github.com/pdp7/talks/blob/master/rv-clc.pdf>

Linux-capable RISC-V chips

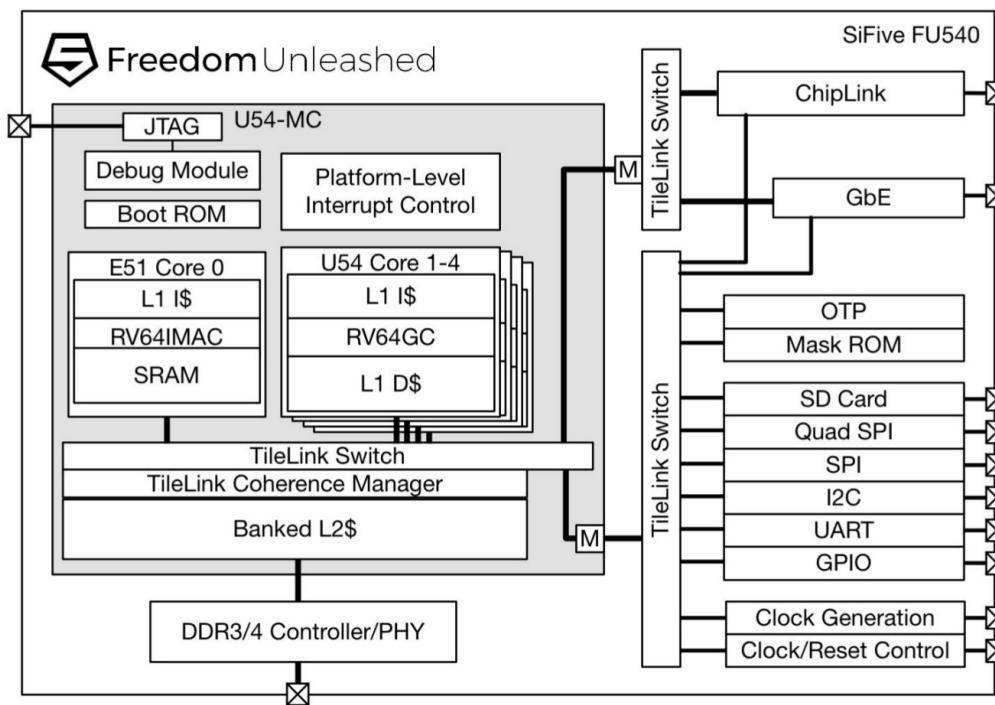

- **SiFive Freedom FU540 SoC**

- FOSDEM 2018 talk: “Igniting the Open Hardware Ecosystem with RISC-V”

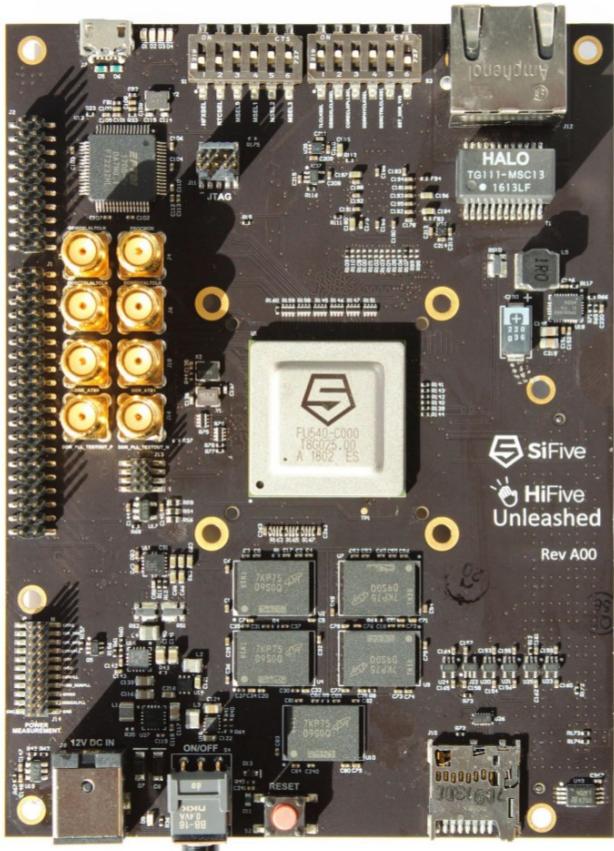

## FU540: Penta-Core 64-bit RISC-V Linux SoC

- **SiFive Freedom FU540 SoC**
  - HiFive Unleashed board:
    - powerful but expensive (\$1,000) and very limited

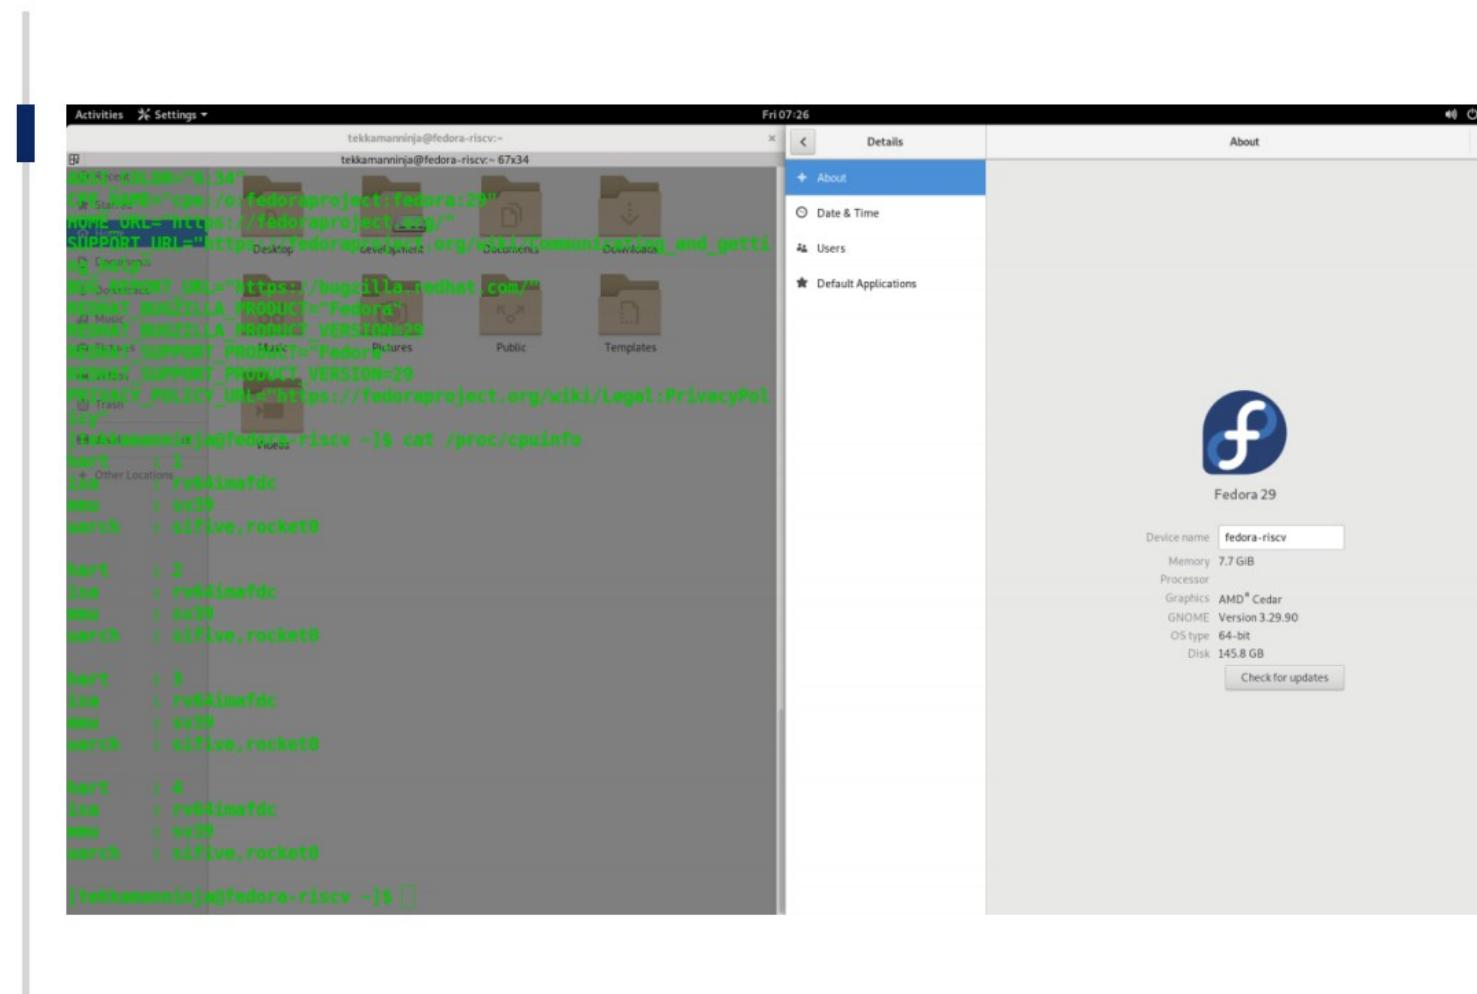

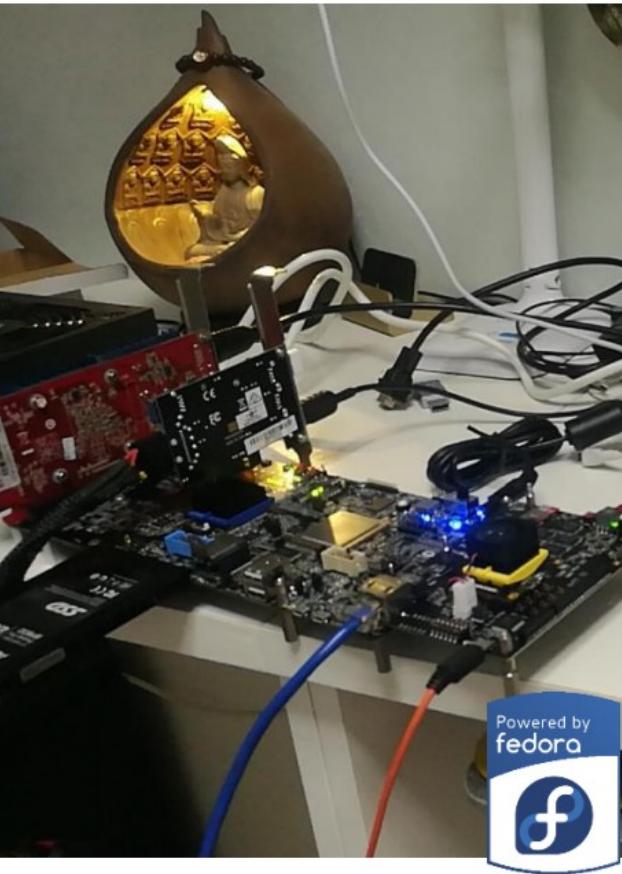

## HiFive Unleashed

- World's First Multi-Core RISC-V Linux Development Board
  - SiFive FU540-C000 (built in 28nm)
    - 4+1 Multi-Core Coherent Configuration, up to 1.5 GHz
    - 4x U54 RV64GC Application Cores with Sv39 Virtual Memory Support
    - 1x E51 RV64IMAC Management Core
    - Coherent 2MB L2 Cache
    - 64-bit DDR4 with ECC
    - 1x Gigabit Ethernet
  - 8 GB 64-bit DDR4 with ECC
  - Gigabit Ethernet Port
  - 32 MB Quad SPI Flash
  - MicroSD card for removable storage
  - FMC connector for future expansion with add-in cards

Drew Fustini @pdpf

Drew Fustini is a hardware designer and embedded Linux developer. He is the Vice President of the Open Source Hardware Association, and a board member of the BeagleBoard Foundation. Drew designs circuit boards for OSH Park, a PCB manufacturing service, and maintains the Adafruit BeagleBone Python library.

FPGAs have been the talk of the town at many of this year's hacker conferences. But what exactly is an FPGA, and why are they so hot right now?

FPGA stands for Field Programmable Gate Array, a digital logic chip that can be programmed to reconfigure the internal hardware. An FPGA does not run software – it physically changes the configuration of its gate arrays to adapt to the task at hand. It's like an FPGA is an incredibly versatile tool! Need 25 PWM pins for a project? No problem. Want to replicate the functionality of a vintage CPU? Your FPGA has you covered. Not only is an FPGA versatile, but it is also better at handling timing-critical tasks than a microcontroller. You can filter high-speed sensor data before it's read by your processor, or offload repetitive tasks like debouncing buttons from the burden on your microcontroller.

FPGAs are hot right now but they're not a new technology – they've been used in industry for decades. However, pricey FPGA development boards and the massive proprietary software suites needed to develop FPGA designs, means that there has historically been limited adoption in the maker community.

When you write an Arduino program, you're using a language called Wiring, a variation of C++. When you press compile, this high-level code is used to generate a binary file that the processor on the Arduino board executes to achieve the purpose of your program. Similarly we describe the circuits we want in an FPGA using a high-level, text-based format known as a hardware description language (HDL), such as Verilog. The HDL design is then transformed by a synthesis tool into the basic building blocks that exist in the FPGA.

This process is normally done with proprietary software from the FPGA vendor, but these tools can take ages to download and devour disk space. That is, until Project Trellis led by David Shah, Claire Wolf, and others, enabled a complete open-source workflow for the Lattice iCE40 FPGA. This opened the door for low-cost, open hardware boards such as myStorm Blackice, TinyFPGA, iCEBreaker, and Fomu, which are great tools for teaching workshops and building projects.

The Lattice ECP5 FPGA is capable of more advanced features than the iCE40, and it's also easier to get started with too, thanks to Project Trellis led by David Shah. This enabled the ECP5-powered Supercon badge to have cool features like HDMI video, while still being open for anyone to hack on without requiring proprietary tools.

FPGAs are a fascinating technology with lots of awesome applications. If you want to find out more, start off by reading Luke Valenty's *The Hobbyists Guide to FPGAs on Hackaday.io* ([hsmag.cc/GOAQnR](https://hsmag.cc/GOAQnR)), and watch Tim Ansell's Supercon talk to learn about the exciting future of open-source FPGA tools ([hsmag.cc/kY5IPD](https://hsmag.cc/kY5IPD)). □

Contributor + ...

Add the [Hackaday Supercon 2019 badge](#) which has an ECP5 FPGA.

These changes are from a [fork](#) by Michael Welling (@mwelling)

During Supercon, we tried two approaches:

- use the built-in 16MB QSPI SRAM
- use add-on cartridge with 32MB SDRAM by Jacob Creedon

We were not able to get the QSPI SRAM working so I've removed those changes, and I have just added the changes that are needed to boot Linux with the 32MB SDRAM.

In addition to @mwelling, thank you to Jacob Creedon (@jcreedon), @gregdavill, Tim Ansell (@mithro), and Sean Cross (@xobs) who all helped get Linux working on this badge.

[Related to comments in PR #31 \(comment\)](#)

The performance of the ECP5 Hackaday Badge with 32MB SDRAM is "painfully" slow.

@mithro suggested there could be some issue with the configuration.

@enjoy-digital has attempted some optimizations:

[#31 \(comment\)](#)

With [enjoy-digital/litedram@ 34e6c24](#) and [enjoy-digital/litex@ fa22d6a](#) we have a ~10% boot time speedup on designs using SDRAM:

- De0Nano: 94.6.s to 84.6s
- ULX3S: 75.9s to 68.2s

On Arty with DDR3 the gain is effect more limited: 8.7s to 8.4s. That would be interesting to test this on the badge.

I will measure if the boot time improve

# Open Source boards with ECP5 FPGA (can run Linux)

# Open Source ECP5 boards

- Radiona.org ULX3S

- <https://www.crowdsupply.com/radiona/ulx3s>

The screenshot shows the Crowd Supply campaign page for the ULX3S board. The top navigation bar includes links for CROWD SUPPLY, BROWSE, LAUNCH, ABOUT US, and a search bar. On the right, there are links for Open Hardware and Development Kits, along with a user profile icon.

The main content area features the title "ULX3S" by Radiona.org / Zagreb Makerspace. Below it, a sub-headline reads "A powerful, open hardware ECP5 FPGA dev board".

A detailed diagram of the ULX3S board is shown in the center, with various components labeled:

- USB 1 connected to FTDI FT231XS
- 3.5 mm audio jack with 4 contacts (analog stereo + digital audio or composite video)
- GPDI (digital video, audio, ethernet ready)
- USB 2 connected directly to FPGA
- 25 MHz onboard, external differential clock input
- 8 user LEDs
- 2 fire buttons
- Lattice ECP5 LFE5U-85F-6BG381C (85K LUT)
- 32MB SDRAM
- ADC: 8 channels, 12 bit, 1 MSa/s MAX11125
- 4 directional buttons
- Placeholder for 0.96" SPI color OLED display
- 2 USB LEDs
- 1 WiFi LED
- 00:15 SD slot

On the right side of the page, the campaign statistics are displayed:

- \$50,793 raised
- of \$15,000 goal
- 338% Funded!
- 5 updates
- 8 days left
- 300 backers

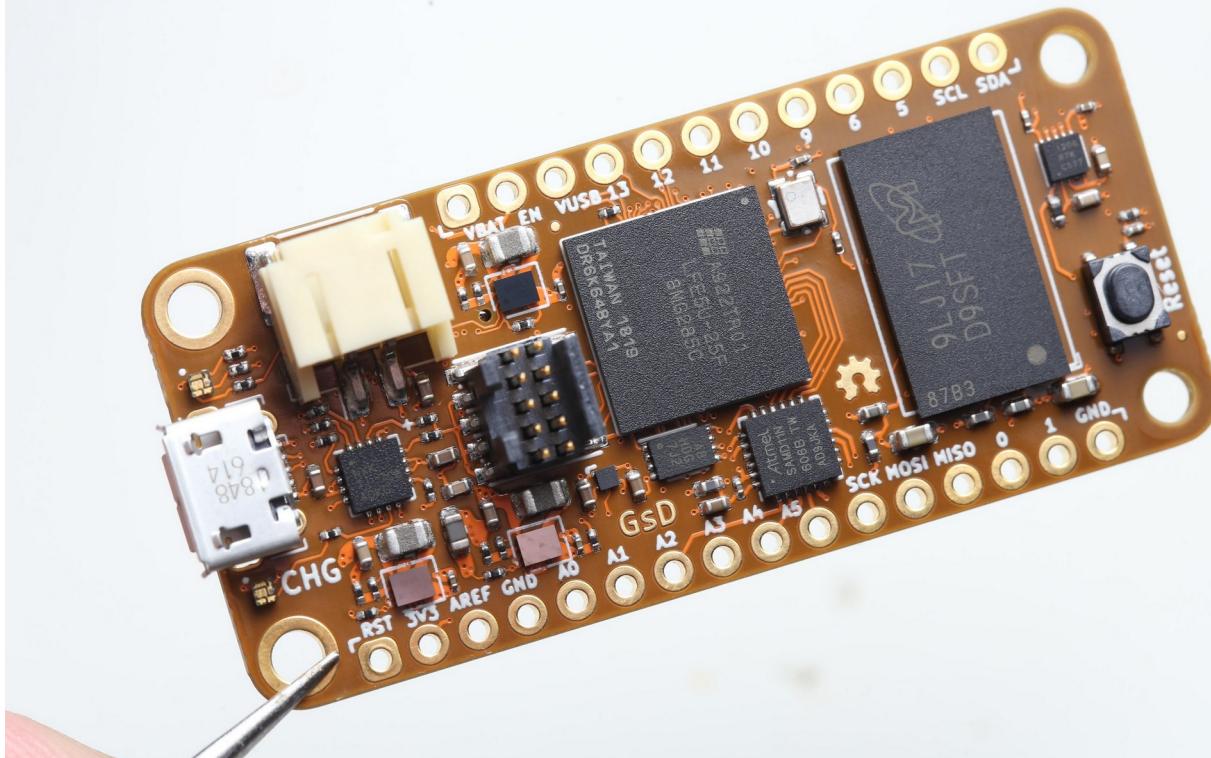

Below the stats, a message says "Last update posted Apr 03, 2020". There is also a field for entering an email address ("me@example.com") and a "Subscribe to Updates" button. Social media icons for Facebook and Twitter are present.

At the bottom, a section titled "PMOD Set" is shown with a price of \$36.
